HINTS & FAQ:

- Make sure that when you run your terminal, you have checked off both "unlimited buffering" and "clear screen at method call" in the options menu of the BlueJ terminal.
- Make sure that you are handling ALL POSSIBLE CASES OF INPUT, including:
  - What happens if you try to print the tallest player if there are no players in the roster yet?
    - Or if there are two players with the same height?
    - The same idea for shortest, best, etc.
- What happens if the user tries to search for a player that does not exist (ie "Harry Potter" is searched for)?
  - The output should be "This player does not exist in the roster" or something along those lines
- Ask questions on Piazza if you have any!
